Here are four ways to maximize the power of Adobe Photoshop:

- Make even the most complex camera and lens correction on a single layer, then apply the same corrections to all the other layers in the image.
- Start with the most important elements in an image, then clone all the other elements, and Photoshop will duplicate and blend them to make them blend seamlessly.
- Convert any layer to a monochrome or grayscale layer and apply the same filter to the entire image. The monochrome layer contains all of the black and white information while the

grayscale allows you to apply more sophisticated and subtle filters and effects.
- Select all the elements in an image then convert them to either a black layer, a white layer or an inverted black or white layer. The inverted black layer reverses a layer's color while the inverted white layer yields a monochrome layer.
