The tool that may pull the eye of everyone in the room is the "Open..." icon. Sometimes, it is called the "Open menu" or "File menu." Using Fast's not only reduces the time it takes to transition between applications, it also boosts efficiency and boosts performance. As Fast became a default pref, Photoshop switched from updating individual property sheets to a faster method that allows it to apply or revert a large number of layers at once. The previous update wasn't possible because of the combination of both the large number of layers must be updated at once and the way Photoshop updates property sheets. Fast changes the rules of the game by allowing Photoshop to use dynamic content rendering, and with that, it allows Photoshop to apply large XML files as one, or apply changes to images that contain an XML background, among other things. The company also introduced a new, on-screen foldable tool palette with more prominent tool icons and new access to the standard options like Blur Variations, Desaturate, Split Toning, and more. While you can tethered-synchronize to Memory Card via a Serial or USB port, you can perform this task from the companion mobile app. You can also roll back changes you make while you're tethered. You can also check your Camera Roll at any time, add photos to a

new library, and even rename photos. In addition to all the changes to the interface and workflows, the update also includes a number of smaller updates on the performance and stability sides. There have been no reported significant stability issues, however, while the update is rolling out.
