A feature useful for processing RAW files is the Curves module, which is very fast to work with. Once I opened RAW file set a Curves preset, changed the tonal and colour elements of the file and then processed it using the curves setting. I find that Lightroom 5 offers a better interface. The file dialogs were improved. It is more intuitive and likely to be used by non-photographers. I find that the original Lightroom, although being able to work with photos of RAW files, is less intuitive than Photoshop. You will either need to be a graphic designer or a programmer to work in the original Lightroom. The problem is that it doesn't always work this way and I still haven't found the perfect combination of software to provide the bang I'd like. For example, LR can't handle large documents and PS can't handle large prints. I've also found that simple operations in LR (e.g. settings for specific areas in an image) are sometimes lost as soon as I move the image over to PS. That said, the new version of PS can, in some ways, actually make people stronger users of the program. I've seen professionals that didn't initially see the value in having so much control over an image and now they do. It isn't a problem of learning the features. For example, I'm almost certain I'll generate a huge number of multi-layer files in the near future. I wonder how I'll do it in the future. Now you can create a snapshot of your document and invite a reviewer to comment on it. Comments show up in real time in a panel within Photoshop where you can see and address them. You can continue to update the PSD with reviewers seeing those updates when the file is refreshed or reopened.

A tool path is essentially a graphic pathway that you draw allowing you to create brush effects, masks, and pen strokes. Once you make the tool path, you can then use the coordinates of it, and when it is filled in, it creates the graphics path that you see on the canvas when you use your tools. These tool paths are rather straight forward, but a few things to keep in mind: first, when creating a new tool path, make sure to create it from the current layer. Second, remember that you cannot add any transparency to the start or the end of the graphic path. Lastly, if using a path in a mask or brush, it will only display whenever there is transparency in the file. e3d0a04c9c
