My first impression was that Lightroom has adapted to changes in the photo industry pretty well. With its new, ruler-based interface, even beginners can find it relatively easy to use. I would have liked to have seen a user-friendly web browser in order to see which photo media I have in my photo library. If I am not taking a photo with my smartphone and I want to select an image from my computer, I can load the photo into the browser and enjoy a DVD-like interface. In order to see more details about a photo, you need to switch to the photo's view tab, but a larger window constantly right below the place where you can see the image is nice and handy. You can drag and drop and resize photos, and even download them to a new project right in the browser. Photoshop users will feel at home and should not have any difficulties, but Lightroom was born from the humble beginnings of a new kind of versioning solution. There is not much, if anything at all, to complain about Lightroom's some of its basic meat and potatoes. The interface is semi-modular and is very flexible. It still feels like a product of that first Photoshop application. Its clean design is evidence of its strong adherence to a set of rules. For example, there are no extremes in button/icon sizes. That means lots of wasted space. The new view tools will help with this, but the look and feel will be completely different. For example, you can view the image as a grid and you can zoom out to see more of the image in a separate view.
